

Gerotor pumps and pump units of series 143

for SKF CircOil centralized lubrication systems

Assembly instructions acc. to EC Dir. 2006/42/EC
for partly completed machinery, with associated operating instructions

EN

Version 02

EN

Information concerning EC Declaration of Conformity

Information concerning EC Declaration of Conformity and EC Declaration of Incorporation

The products
gerotor pumps of product series:
143

are hereby confirmed to comply with the essential protection requirements stipulated by the following Directive(s) of the Council on the approximation of laws of the Member States:

- **Machinery Directive 2006/42/EC**
- **Low Voltage Devices 2014/35/EU**
- **RoHS II Directive 2011/65/EU**

Note:

(a) This declaration certifies compliance with the aforementioned Directives but does not constitute a guarantee of characteristics.

(b) The safety instructions in the documentation included with the product must be observed.

(c) The commissioning of the products here certified is prohibited until the machine, vehicle, or similar in which the product is installed conforms with the provisions and

adherence to the installation instructions, can negatively impact the EMC characteristics and electrical safety.

We further declare:

- The aforementioned product is, according to **EC Machinery Directive 2006/42/EC, Annex II Part B**, designed for installation in machinery / for incorporation with other machinery to form a machine. Within the scope of the EC Directive, commissioning shall be prohibited until the machinery in which this product is installed conforms with the provisions of this Directive.
- The aforementioned product may, with reference to **EC Directive 97/23/EC concerning pressure equipment**, only be used in accordance with its intended use and in conformity with the instructions provided in the documentation. The following must be observed in this

in conjunction with fluids of Group 1 (Dangerous Fluids) as defined in Article 2, Para. 2 of Directive 67/548/EEC of June 27, 1967. The product is neither designed nor approved for use in conjunction with gases, liquefied gases, pressurized gases in solution, vapors, or such fluids whose vapor pressure exceeds normal atmospheric pressure (1013 mbar) by more than 0.5 bar at their maximum permissible temperature.

When used in conformity with their intended use, products supplied by SKF do not reach the limit values listed in Article 3, Para. 1, Clauses 1.1 to 1.3 and Para. 2 of Directive 97/23/EC. They are therefore not subject to the requirements of Annex 1 of the Directive. Consequently, they do not bear a CE marking in respect of Directive 97/23/EC. SKF classifies them according to Article 3, Para. 3 of the Directive. The Declaration of Conformity and Incorporation forms part of the product documentation and is supplied together with the product.

Masthead

These assembly instructions pursuant to EC Machinery Directive 2006/42/EC are an integral part of the product described here and must be kept for future use.

Warranty

The instructions do not contain any information on the warranty. This can be found in the General Terms and Conditions.

Copyright / Integration of instructions

© SKF Lubrication Systems Germany GmbH. All rights reserved.

These instructions are protected by copyright.

The use of the contents for the purpose of integration into the documentation of the machine manufacturer in whose product it will be integrated is expressly allowed. This also includes the preparation of training documents for internal, non-commercial purposes. Any other usage of any kind without written permission of the rights holder is prohibited and constitutes a violation of copyright.

1. Safety instructions

1. Safety instructions

1.1 General safety instructions

The operator must ensure that the assembly instructions/operating instructions are read by all persons tasked with working on the product or who supervise or instruct such persons. The operator must also ensure that the staff fully understands the content of the instructions.

The assembly instructions/operating instructions must be kept readily available together with the product.

Note that the assembly instructions/operating instructions form part of the product and must accompany the product if sold to a new owner.

The product described here was manufactured according to the state of the art.

Risks may, however, arise from its usage and may result in harm to persons or damage to other material assets.

Any malfunctions which may affect safety must be remedied immediately. In addition to the assembly instructions/operating

environmental protection must be observed and applied.

1.2 General behavior when handling the product

- The product may only be used in awareness of the potential dangers, in proper technical condition, and according to the information in this manual.

- Technical personnel must familiarize themselves with the functions and operation of the product. The specified assembly and operating steps and their sequences must be observed.

- Any unclear points regarding proper condition or correct assembly/operation must be clarified. Operation is prohibited until issues have been clarified.

- Unauthorized persons must be kept

- All safety instructions and in-house instructions relevant to the particular activity must be observed.

- Responsibilities for different activities must be clearly defined and observed. Uncertainty seriously endangers safety.

- Protective and safety mechanisms cannot be removed, modified, or disabled during operation and must be checked for proper function and completeness at regular intervals.

If protective and safety mechanisms must be removed, they must be installed immediately following conclusion of work and then checked for proper function.

- Any malfunctions that occur must be resolved according to responsibility. The operator of the system/machine must

be notified in case of malfunctions outside the scope of responsibility.

- o Wear personal protective equipment.
- o Observe the relevant safety data sheets when handling lubricants.

1.3 Qualified technical personnel

Only qualified technical personnel may install, operate, maintain, and repair the products described in the assembly instructions. Qualified technical personnel are persons who have been trained, assigned, and instructed by the operator of the final product into which the product described here is incorporated. Such persons are familiar with the relevant standards, rules, accident prevention regulations, and assembly conditions as a result of their training, experience, and instruction. They are qualified to carry out the required activities and in doing so recognize and avoid any potential hazards. The definition of qualified personnel and the prohibition against employing non-qualified personnel are laid down in DIN VDE 0105 and IEC 364.

Relevant country-specific definitions of qualified technical personnel apply for countries outside the scope of DIN VDE 0105 or IEC 364. The core principles of these country-specific qualification requirements for technical personnel cannot be below those

of the two standards mentioned above.

The operator of the final product is responsible for assigning tasks and areas of responsibility and for the responsibility and monitoring of the personnel. These areas must be precisely specified by the operator. The personnel must be trained and instructed if they do not possess the requisite knowledge.

Product training can also be performed by SKF in exchange for costs incurred.

The operator must ensure that its personnel have fully understood the content of the assembly instructions/operating instructions.

SKF

9

EN

1. Safety instructions

1.4 Electric shock hazard

Electrical connections for the described product may only be established by qualified and trained personnel authorized to do so by the operator, and in observance of the local electrical operating conditions and local regulations (e.g., DIN, VDE). Serious injury or death and property damage may result from improperly connected products.

		WARNING
	Electric shock Performing work on products that have not been de-energized may result in serious injury or death. Assembly, maintenance, and repair work may only be performed on products that have been de-energized by qualified technical personnel. The supply voltage must be switched off before work is performed.	

1.5 System pressure or hydraulic pressure hazard

		WARNING
	System pressure Hydraulic pressure Lubrication systems are pressurized during operation. Centralized lubrication systems must therefore be depressurized before starting assembly, maintenance, or repair work, or any system modifications or system repairs.	

1.6 Operation

The following must be observed during commissioning and operation.

- o All information within this manual and the information within the referenced documents
- o All laws/regulations that the operator must observe
- o The information on explosion protection according to Directive 1999/92/EC (ATEX 137), if necessary

1.7 Assembly/maintenance/malfunction/decommissioning/disposal

The following must be observed while working on the product.

- o All relevant persons (e.g., operating personnel, supervisors) must be informed of the activity prior to the start of work. Precautionary operational measures / work instructions must be observed.
- o Take appropriate measures to ensure that moving/detached parts are immobilized during the work and that no body parts can be pinched by unintended movements.
- o Assemble the product only outside the operating range of moving parts, at an adequate distance from sources of heat or cold.
- o Prior to performing work, the product and the machine/system in which the product is or will be integrated must be depressurized and secured against unauthorized activation.
- o All work on electrical components may be performed only with voltage-insulated tools.
- o Fuses must not be bridged. Always replace fuses with fuses of the same type.
- o Ensure proper grounding of the product.
- o Drill required holes only on non-critical, non-load-bearing parts.
- o Other units of the machine/the vehicle must not be damaged or impaired in their function by the installation of the centralized lubrication system.
- o No parts of the centralized lubrication device may be subjected to torsion, shear, or bending.
- o Use suitable lifting gear when working with heavy parts.
- o Avoid mixing up/incorrectly assembling disassembled parts. Label parts.

SKF

11

1.8 Intended use

Gerotor pumps/pump units of SKF series 143 are used to supply centralized lubrication systems with lubricant and are intended for use in centralized lubrication systems. They feed mineral and synthetic oils that are compatible with plastic and NBR elastomers or FKM (FPM). The permissible operating viscosity for the oils is 20 to 1000 mm²/s at a permissible pumped medium temperature of 0 to 80°C.

The assembly instructions in Chapter 4 of these operating instructions must be adhered to. The information in Chapter 9 of the operating instructions, "Technical data," must also be observed.

Only media approved for these gerotor pumps/pump units may be used. Unsuitable media may result in pump unit failure and potentially severe bodily injury or death and property damage. The use of synthetic and biodegradable oils requires prior approval from SKF.

Unless specially indicated otherwise, gerotor pumps/pump units of SKF series 143 are not approved for use in potentially explosive areas as defined in the ATEX Directive 94/9/EC.

Any other usage is deemed non-compliant with the intended use.

1.9 Foreseeable misuse

Any usage of the product differing from the aforementioned conditions and stated purpose is strictly prohibited. Particularly prohibited are use:

- o To feed / forward / store Group 1 dangerous fluids according to Directive 67/548/EEC
- o In another, more critical explosion protection zone, if applied as ATEX
- o To feed / forward / store Group 1 dangerous fluids according to Directive 67/548/EEC
- o To feed / forward / store gases, liquefied gases, dissolved gases, vapors, or fluids whose vapor pressure exceeds normal atmospheric pressure (1013 mbar) by more than 0.5 bar at their maximum permissible operating temperature

1.10 Disclaimer of liability

SKF shall not be held responsible for damages:

- o Resulting from failure to comply with these instructions
- o Caused by contaminated or unsuitable lubricants
- o Caused by the installation of non-original SKF components or SKF spare parts
- o Caused by inappropriate usage
- o Resulting from improper assembly, configuration, or filling
- o Resulting from improper response to malfunctions
- o Caused by non-observance of maintenance intervals
- o Caused by independent modification of system components
- o Only media approved for these types of units may be used. Unsuitable media may result in pump unit failure and potentially severe bodily injury or death and property damage.

1.11 Referenced documents

In addition to this manual, the following documents must be observed by the respective target group:

- o Operating and assembly instructions from the coupling and motor manufacturer
- o Operational instructions / approval rules
- o Instructions from suppliers of purchased parts
- o Manual for the insulation resistance tester
- o Safety data sheet of the lubricant used
- o Project planning documents and other relevant documents, if provided

The operator must supplement these documents with applicable national regulations for the country of use. This documentation must be included if the product/machine is sold or transferred.

SKF

13

1. Safety instructions

1.12 Warning labels on the product

A rotation arrow and (on larger pump types: 30, 40, 50 l/min) a "Hot surface" sign are affixed on the product. Before commissioning, check that these are present and intact. Immediately replace warning labels if damaged or missing. The product must not be operated until then.

1.13 Residual risks

Residual risk	Remedy
Life cycle: Assembly	
Electric shock due to defective power lead/mains plug	<ul style="list-style-type: none"> Inspect the power lead/mains plug for damage before starting gerotor pump units of SKF series 143.
People slipping due to floor contamination with spilled/leaked lubricant	<ul style="list-style-type: none"> Exercise caution when connecting the gerotor pump unit's hydraulic connections. Promptly apply suitable binding agents and remove the leaked/spilled lubricant. Follow operational instructions for handling lubricants and contaminated parts
Tearing/damage to lines when installed on moving machine components	<ul style="list-style-type: none"> If possible, do not install on moving parts; if this cannot be avoided, use flexible hose lines.
Life cycle: Commissioning / operation	
Electric shock due to defective power lead/mains plug	<ul style="list-style-type: none"> Before starting up gerotor pump units of SKF series 143, check the power lead/mains plug for damage.
Lubricating oil spraying out due to faulty component fitting/line connection.	<ul style="list-style-type: none"> Securely tighten all components with a suitable tool or using the specified torques. Use hydraulic screw unions and lines suitable for the indicated pressures. These must be checked for proper connection and for damage prior to commissioning.
Life cycle: Setup, retrofit	
People slipping due to floor contamination with spilled/leaked lubricant	<ul style="list-style-type: none"> Exercise caution when loosening or connecting the gerotor pump unit's hydraulic connections. Promptly apply suitable binding agents and remove the leaked/spilled lubricant. Follow operational instructions for handling lubricants and contaminated parts

1. Safety instructions

Residual risk	Remedy
Life cycle: Malfunctions, fault-finding	
Life cycle: Maintenance, repair	
Electric shock due to defective power lead/mains plug	<ul style="list-style-type: none"> Inspect the power lead/mains plug for damage before starting gerotor pump units of SKF series 143.
Electric shock from open electric motor or active energized components	Disconnect the mains plug (cut power) before performing any work on electrical components. Exercise caution when winding and unwinding the power lead and when operating the gerotor pump unit.
Strong heating of the electric motor due to a motor jam or continuous duty	Turn off the pump motor and let it cool down. Remedy the cause
People slipping due to floor contamination with spilled/leaked lubricant	<ul style="list-style-type: none"> Exercise caution when loosening or connecting the gerotor pump unit's hydraulic connections. Promptly apply suitable binding agents and remove the leaked/spilled lubricant. Follow operational instructions for handling lubricants and contaminated parts
Life cycle: Decommissioning, disposal	
Environmental contamination by lubricants and wetted parts	<ul style="list-style-type: none"> Dispose of contaminated parts according to the applicable legal/company rules
People slipping due to floor contamination with spilled/leaked lubricant	<ul style="list-style-type: none"> Exercise caution when loosening the gerotor pump unit's hydraulic connections. Promptly apply suitable binding agents and remove the leaked/spilled lubricant. Follow operational instructions for handling lubricants and contaminated parts
Environmental contamination by lubricants and wetted parts	<ul style="list-style-type: none"> Dispose of contaminated parts according to the applicable legal/company rules

2. Lubricants

2.1 General information

NOTE

All products from SKF Lubrication Systems may be used only for their intended purpose and in accordance with the information in the product's operating instructions.

Intended use is the use of the products for the purpose of providing centralized lubrication/lubrication of bearings and friction points using lubricants within the physical usage limits which can be found in the documentation for the devices, e.g., operating instructions and the product descriptions, e.g., technical drawings and catalogs. Particular attention is called to the fact that hazardous materials of any kind, especially those materials classified as hazardous by EC Directive 67/548/EEC, Article 2, Para. 2, may only be filled into SKF centralized lubrication systems and components and delivered and/or distributed with such systems and components after consulting

with and obtaining written approval from SKF Lubrication Systems.

No products manufactured by SKF Lubrication Systems are approved for use in conjunction with gases, liquefied gases, pressurized gases in solution, vapors, or such fluids whose vapor pressure exceeds normal atmospheric pressure (1013 mbar) by more than 0.5 bar at their maximum permissible temperature.

Other media which are neither lubricant nor hazardous substance may only be fed after consultation with and written approval from SKF Lubrication Systems.

SKF Lubrication Systems considers lubricants to be an element of system design that must always be factored into the selection of components and the design of centralized lubrication systems. The lubricating properties of the lubricants are critically important in making these selections.

2.2 Selection of lubricants

NOTE

Observe the instructions from the machine manufacturer regarding the lubricants that are to be used. The amount of lubricant required at a lubrication point is specified by the bearing or machine manufacturer. It must be ensured that the required quantity of lubricant is provided to the lubrication point. The lubrication point may otherwise not receive adequate lubrication, which can lead to damage and failure of the bearing.

Selection of a lubricant suitable for the lubrication task is made by the machine/system manufacturer and/or the operator of the machine/system in cooperation with the lubricant supplier.

When selecting a lubricant, the type of bearings/friction points, the expected load during operation, and the anticipated ambient conditions must be taken into account. All economic and environmental aspects must also be considered.

SKF

17

2.3 Approved lubricants

NOTE

If necessary, SKF Lubrication Systems can help customers to select suitable components for feeding the selected lubricant and to plan and design their centralized lubrication system.

Please contact SKF Lubrication Systems if you have further questions regarding lubricants. It is possible for lubricants to be tested in the company's laboratory for their suitability for pumping in centralized lubrication systems (e.g., "bleeding"). You can request an overview of the lubricant tests offered by SKF Lubrication Systems from the company's Service department.

NOTE

Only lubricants approved for the product may be used. Unsuitable lubricants can lead to failure of the product and to property damage.

NOTE

Different lubricants must not be mixed together. Doing so can cause damage and require costly and complicated cleaning of the product/lubrication system. It is recommended that an indication of the lubricant in use be attached to the lubricant reservoir in order to prevent accidental mixing of lubricants.

The product described here can be operated using lubricants that meet the specifications in the technical data. Depending on the product design, these lubricants may be oils, fluid greases, or greases.

Mineral, synthetic, and/or rapidly biodegradable oils and base oils can be used. Consistency agents and additives may be added depending on the operating conditions.

Note that in rare cases, there may be lubricants whose properties are within the permissible limits values but whose other characteristics render them unsuitable for use in centralized lubrication systems. For example, synthetic lubricants may be incompatible with elastomers.

2.4 Lubricants and the environment

2.5 Lubricant hazards

NOTE

Lubricants can contaminate soil and waterways. Lubricants must be properly used and disposed of. Observe the local regulations and laws regarding the disposal of lubricants.

It is important to note that lubricants are environmentally hazardous, flammable substances which require special precautionary measures during transport, storage, and processing. Consult the safety data sheet from the lubricant manufacturer for information regarding transport, storage, processing, and environmental hazards of the lubricant that will be used. The safety data sheet for a lubricant can be requested from the lubricant manufacturer.

WARNING

Lubricants
Gerotor pumps must always be free of leaks. Leaking lubricant is hazardous due to the risk of slipping and injury. Beware of any lubricant leaking out during assembly, operation, maintenance, or repair of centralized lubrication systems. Leaks must be sealed off without delay.

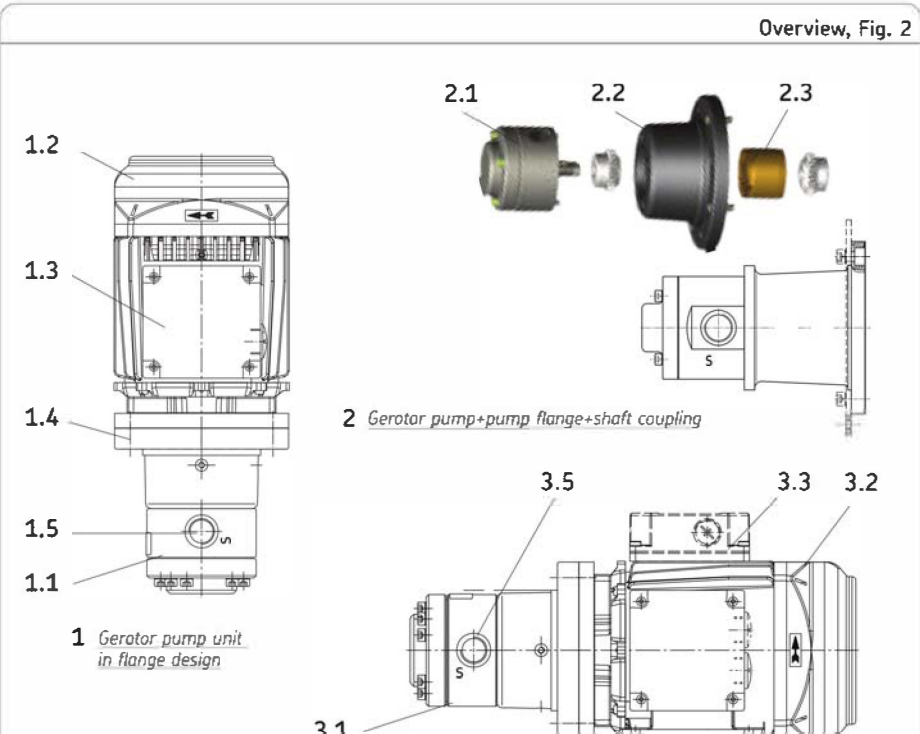

Lubricant leaking from centralized lubrication systems is a serious hazard. Leaking lubricant can create risks that may result in physical harm to persons or damage to other material assets.

NOTE

Follow the safety instructions on the lubricant's safety data sheet.

3.2 Order example

143-11ND03E-RA+1FX

- o Gerotor pump unit of product series 143
- o Motor in foot design
- o Sealing NBR
- o Nominal delivery rate 1.7 l/min
- o Back pressure 30 bar
- o Motor index 0.37 kW
- o Terminal box on right
- o Motor certification CE
- o 220–240 V / 380–420 V, 50 Hz
254–280 V / 440–480 V, 60 Hz

If ordering gerotor pump+ pump flange+ shaft coupling (model design 3), the following is not applicable: **D - F**
- Example: 143-13ND03E

If ordering the gerotor pump (model design 4), **D - F** and item 4 of the code for the pump design are not applicable.
- Example: 143-14ND03

4. Assembly

4. Assembly

4.1 General information

Only qualified technical personnel may install, operate, maintain, and repair the gerotor pumps of pump series 143 described in the assembly instructions. Qualified technical personnel are persons who have been trained, assigned and instructed by the operator of the final product into which the gerotor pumps described here are incorporated.

Such persons are familiar with the relevant standards, rules, accident prevention regulations, and operating conditions as a result of their training, experience, and instruction. They are qualified to carry out the required activities and in doing so recognize and avoid potential hazards.

Before assembling/setting up the product, the packaging material and any shipping braces (e.g., plugs) must be removed. The packaging material must be preserved until any discrepancies are resolved.

- Check the gerotor pump/pump unit for any shipping damages and for completeness.

NOTE

The gerotor pump must be installed in a stress-free position and it must be ensured it is not subject to any radial or axial forces.

CAUTION

Slipping hazard

Centralized lubrication systems must always be free of leaks. Leaking lubricant is hazardous due to the risk of slipping and injury. Beware of any lubricant leaking out during assembly, operation, maintenance, or repair of centralized lubrication systems. Leaks must be sealed off without delay.

The definition of qualified personnel and the prohibition against employing non-qualified personnel are laid down in DIN VDE 0105

4.2 Setup and attachment

The product should be protected from humidity and vibration, and should be mounted so that it is easily accessible, allowing all further installation work to be done without difficulty.

Ensure that there is sufficient air circulation to prevent the product from overheating. For the maximum permissible ambient temperature, see the "Technical data" Chapter. The mounting position of the product is as shown in the assembly drawing.

SKF gerotor pump units of product series 143 can be installed horizontally as well as vertically, depending on the design. The gerotor pump units are available in a foot or flange design. Depending on the model, they can be mounted separately from the lubricant reservoir or flanged to a lubricant reservoir. When set up separately, the suction port

of the pump may be connected to a lubricant reservoir that is situated higher (max. 2000 mm).

To flange the gerotor pump unit to a lubricant reservoir horizontally below the oil level, use a sealed pump in a special design. Consult SKF's Service department.

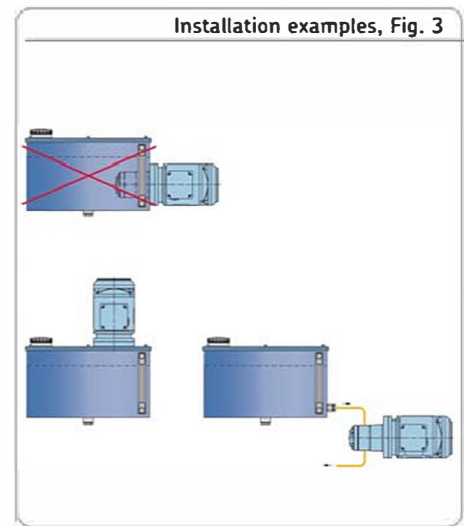

A customer-specific electric motor can be connected to the "pump with flange and coupling" design.

The flange allows for the installation of all IEC standard motors with flange according to DIN EN 5034, design FT (with threaded holes). See the drawings for the geometric dimensions of the flange.

When installing gerotor pumps without a motor, for example as an integrated/attached pump on a machine housing, ensure that no radial or axial load is applied to its drive shaft.

The pumps can be installed in any position.

Installation examples, Fig. 3

EN

4. Assembly

4.2.1 Installation instructions

If the pumps are used in systems lacking open delivery lines, pressure-regulating valves must be provided to limit the maximum system pressure. The selected cross-section of the intake tube must be equal to or greater than the cross-section of the pump's suction port. SKF recommends the use of filters for trouble-free operation of the pump/pump unit. Effective filtration prevents malfunctions while also increasing the service life of the pump.

A pumped medium of at least the purity class 20/17/14 according to ISO 4406(c) is recommended. This corresponds to the U.S. standard NAS code (1638) class 8 and SAWAS 4059 class 8.

A filter rating of approx. 5 to 10 µm meets this requirement.

The filter rating used is always based on the most sensitive component in the entire system. This is not necessarily the pump.

The following applies in general:

- o Prior to beginning installation, ensure that the scope of delivery for the gerotor pump is complete and inspect for any damage or corrosion.
- o The maximum permissible operating temperature (lubricant temperature) must not be exceeded. Install a heat exchanger if necessary.
- o Carefully clean screw unions and tubing prior to beginning installation.
- o Lubricant exiting from the return line must not be immediately resuctioned under any circumstances.
- o The intake and return lines in the lubricant reservoir must be below the minimum lubricant level in all operating states. This prevents air and foam from being suctioned.
- o It must be ensured that screw unions, connections, and connection elements
- o SKF recommends the installation of return line or pressure filters. However, suction filters should only be used in conjunction with electric negative pressure switches or contamination indicators.
- o Different lubricants must not be mixed together.
- o No radial or axial forces on the pump driveshaft are allowed.
- o The motor and pump shafts must be aligned exactly (see instructions from coupling manufacturer).
- o Use only couplings suitable for compensating for shaft displacements.
- o Connect the gerotor pump as indicated by the rotation arrow (gerotor pump = > see Fig. 11; gerotor pump unit => see Fig. 1).
- o The gerotor pump may only be commissioned and operated with an oil supply; the gerotor pump must not run dry.

4.2.2 Information on assembly holes

- o Ensure cleanliness; components must be installed without contamination.
- o Do not use any cleaning wipes containing lint.
- o Existing supply lines must not be damaged by assembly work.
- o Other units must not be damaged by assembly work.
- o The product must not be installed within range of moving parts.
- o The product must be installed at an adequate distance from sources of heat.
- o Maintain safety clearances and comply with local regulations for assembly and accident prevention.

WARNING

Personal injury / property damage

Drill assembly holes in such a way that no lines, units, or moving parts are damaged or their function impaired. Maintain safety clearances and comply with regulations for assembly and accident prevention.

NOTE

Observe the technical data (Chapter 9).

4.2.3 Minimum mounting dimensions

To ensure enough space for maintenance work and for any disassembly of the product, ensure that the minimum mounting dimensions (Figs. 4 and 7) are maintained.

4. Assembly

4.3.4 Installation of the gerotor pump

☞ see Chapter 4.3.1, Figure 4 as well as Chapter 4.3.3, Dimensions and Technical Data, pages 30 and 31

The mounting surface for the gerotor pump must be free of dust particles, machining chips, rust, and paint residue. If necessary, clean this surface prior to flanging.

NOTE

No radial or axial active forces may occur at the shaft extension of the gerotor pump. The gerotor pump may only be commissioned and operated with an oil supply; the gerotor pump must not run dry.

- Set up the flanging surface and mounting threads (M6, M8, or M10) according to the gerotor pump (Fig. 4, illus. 1 to 3).

- Set up the adapter (provided by customer) according to the shaft extension of the gerotor pump (Fig. 4, illus. 4 to 6).

- Clean the flanging surface.

Fastening material provided by customer in corrosion-protected design:

- o Cheese-head screws with hexagon socket Illus. 1 to 2 = 2x, illus. 3 = 4x, acc. to DIN EN ISO 4762, M6 or M8, strength class 8.8 (10.9)
- o Washers, illus. 1 to 2 = 2x illus. 3 = 4x, acc. to ISO 7090, ID 6 or 8 mm, strength class 200-HV

☞ During subsequent assembly, it must be possible to fit the shaft extension of the pump into the coupling part (provided by customer) without difficulty.

- If necessary, rotate the shaft extension of

- Carefully place and align the gerotor pump on the flanging surface.
- Insert cheese-head screws into the gerotor pump, apply the pump to the installation surface and tighten gently.
- Align the gerotor pump, tighten the cheese-head screws crosswise with the following tightening torque

Torque	M6	10 ±2 Nm
	M8	18 ±2 Nm
	M10	30 ±2 Nm

- Remove protective plugs (inlet/outlet).
- ☞ Consult the table of torques from the fitting manufacturer (suction and delivery screw union).
- Apply the suction and delivery screw union to the gerotor pump and tighten with the torque specified by the fitting manufacturer.
- Check to make sure that the gerotor pump runs smoothly by rotating the drive shaft several times (if possible, turn the

4.3.5 Installation of the gerotor pump with pump flange and shaft coupling

see Chapter 4.3.2, Figure 5 as well as Chapter 4.3.3, Dimensions and Technical Data, pages 30 and 31

The mounting surface for the gerotor pump with pump flange must be free of dust particles, machining chips, rust, and paint residue.

NOTE

No radial or axial active forces may occur at the shaft extension of the gerotor pump. The gerotor pump may only be commissioned and operated with an oil supply; the gerotor pump must not run dry.

- Set up the flanging surface and mounting threads (M6, M8, or M10) according to the gerotor pump (Fig. 5, illus. 1 to 3).
- Set up the adapter (provided by customer) according to the coupling assembly of the gerotor pump (Fig. 5, illus. 7 to 9) and the motor connection (illustration 10) as well as Chapter 11.1.3, Figure 11.

- Clean the flanging surface.

Fastening material in corrosion-protected design:

- o Cheese-head screws with hexagon socket 4x acc. to DIN EN ISO 4762, M6, M8, or M10, strength class 8.8
- o Washers 4x acc. to ISO 7090, ID 6, 8, or 10 mm, strength class 200-HV

During subsequent assembly, it must be possible to fit the shaft extension of the pump into the coupling part without difficulty.

- If necessary, rotate the shaft extension of the gerotor pump again according to the position of the drive slot.
- Carefully place and align the gerotor pump with pump flange on the flanging surface.
- Insert cheese-head screws into the pump flange, apply the flange to the installation surface and tighten gently.

- Align the pump flange and tighten the cheese-head screws crosswise with the following tightening torque

Torque	M6	10 ±2 Nm
	M8	18 ±2 Nm
	M10	30 ±2 Nm

- Remove protective plugs (inlet/outlet).
- Consult the table of torques from the fitting manufacturer (suction and delivery screw union).
- Apply the suction and delivery screw union to the gerotor pump and tighten with the torque specified by the fitting manufacturer.
- Check to make sure that the gerotor pump runs smoothly by rotating the drive shaft several times (if possible, turn the drive train by hand).

4. Assembly

4.4.4 Assembly of gerotor pump unit in foot design, type IM B34

see Chapter 4.4.1, Figure 6 as well as Chapter 4.4.3, Dimensions and Technical Data, pages 36 and 37

NOTE

The gerotor pump may only be commissioned and operated with an oil supply; the gerotor pump must not run dry.

The mounting surface for the gerotor pump unit must be free of dust particles, machining chips, rust, and paint residue. If necessary, clean this surface prior to flanging.

Set up the flanging surface and mounting threads (M6, M8, or 10) according to the gerotor pump unit.

- Clean the flanging surface.
- Fastening material provided by customer

- Hexagon head screws, 4x acc. to DIN EN ISO 4017, M6, M8, or M10, strength class 8.8

- Washers, 4x acc. to ISO 7090, ID 6, 8 or 10 mm, strength class 200-HV

- Carefully place and align the gerotor pump unit on the flanging surface.
- Insert hexagon head screws into the pump feet, apply the feet to the installation surface and tighten gently.
- Align the gerotor pump unit, tighten hexagon head screws with the following tightening torque

Torque

$$M6 = 10 \pm 2 \text{ Nm}$$

$$M8 = 18 \pm 2 \text{ Nm}$$

$$M10 = 30 \pm 2 \text{ Nm}$$

- Consult the table of torques from the fitting manufacturer (suction and delivery screw union).

- Apply the suction and delivery screw union to the gerotor pump and tighten with the torque specified by the fitting manufacturer.
- Check to make sure that the gerotor pump runs smoothly.

Gerotor pump unit in foot design, Fig. 8

4.4.5 Assembly of gerotor pump unit in flange design, type IM B14

☞ see Chapter 4.4.2, Figure 7 as well as Chapter 4.4.3, Dimensions and Technical data, pages 36 and 37

NOTE

The gerotor pump may only be commissioned and operated with an oil supply; the gerotor pump must not run dry.

The mounting surface for the gerotor pump unit must be free of dust particles, machining chips, rust, and paint residue. If necessary, clean this surface prior to flanging.

- Set up the flanging surface and mounting threads (M6, M8, or 10) according to the gerotor pump unit.
- Clean the flanging surface.
Fastening material provided by customer in corrosion-protected design:

- o Cheese-head screws with hexagon socket 4x acc. to DIN EN ISO 4762, M6, M8, or M10, strength class 8.8

- o Washers, 4x acc. to ISO 7090, ID 6, 8, or 10 mm, strength class 200-HV

- Carefully place and align the gerotor pump unit on the flanging surface.
- Insert cheese-head screws into the flange/mounting plate, apply the plate to the installation surface and tighten gently.

- Align the gerotor pump unit, tighten cheese-head screws crosswise with the following tightening torque

Torque

M6 = 10 ±2 Nm

M8 = 18 ±2 Nm

M10 = 30 ±2 Nm

- Remove protective plugs (inlet/outlet).

☞ Consult the table of torques from the fitting manufacturer (suction and delivery screw union).

- Apply the suction and delivery screw union to the gerotor pump and tighten with the torque specified by the fitting manufacturer.
- Check to make sure that the gerotor pump runs smoothly.

4.4.6 Electrical motor connection

WARNING

Electric shock

Electrical connections for the product may only be established by qualified and personnel authorized to do so by the operator. The local electrical operating conditions and local regulations (e.g., DIN, VDE) must be observed.

Consult the motor's rating plate for the electrical characteristics of the motor, such as rated voltage, rated frequency, and rated current (see operating instructions, Chapter 11.1). Observe the guidelines in EN 60034-1 (VDE 0530-1) for operation at the limits of the ranges A (combination of ±5% voltage deviation and ±2% frequency deviation) and B (combination of ±10% voltage deviation

This applies especially with regard to heating and deviations in operating parameters from the ratings on the motor's rating plate. The limits must never be exceeded.

Be sure to connect the motor so as to guarantee a continuously safe electrical connection (no protruding wire ends); use the assigned cable end fittings (e.g. cable lugs, wire end ferrules). Select connecting cables conforming to DIN VDE 0100 taking into account the rated current and the conditions of the specific system (e.g. ambient temperature, type of routing etc. in accordance with DIN VDE 0298 or EC / EN 60204-1).

Details regarding electrical connection of the motor to the power supply, especially terminal and connector pin assignment, can be taken from the following motor data table or customer drawing (if available).

WARNING

Electric shock / damage to pump motor

The available mains voltage (supply voltage) must match the specifications on the rating plate of the motor or of the electrical components. Check the fuse protection of the electrical circuit. Use only fuses with the prescribed amperage,

WARNING

Damage to pump motor/pump

When establishing the electrical connection of the pump motor, be mindful of the correct direction of rotation. The direction of rotation must match the arrow on the motor.

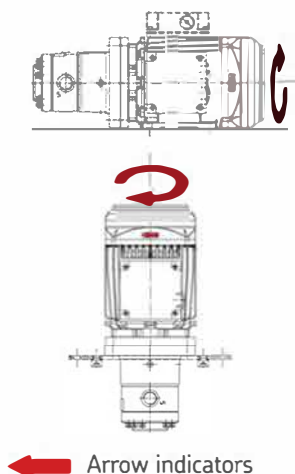

- Connect the pump unit motor according to the specifications on the motor rating plate and the motor characteristics.
- Check the direction of motor rotation based on the rotation arrow and the direction of motor fan impeller rotation.

NOTE

A detailed explanation of the motor rating plates and IEC cage motors is contained in Chapter 11.1 of the enclosed operating instructions.

4.5 Lubrication line arrangement

When arranging the main lubricant lines and lubrication point lines, observe the following instructions in order to ensure that the entire centralized lubrication system functions smoothly.

The main lubricant line must be dimensioned in accordance with the maximum operating pressure occurring in the gerotor unit used and the displacement of that lubrication unit. If possible, the main lubricant line should rise upward from the gerotor pump unit and be ventable at the highest point on the lubrication line system. Lubricant distributors at the end of the main lubricant line must be installed such that their outlets point upwards. If the system configuration requires that the lubricant feeders be arranged below the main lubricant line, they should not be placed at the end of the main lubricant line.

The tubes, hoses, shutoff valves, directional control valves, fittings, etc. that will be used

SKF**41**

EN

4. Assembly

must be designed for the maximum operating pressure of the gerotor unit, the permissible temperatures, and the lubricants that will be delivered. The lubrication line system also needs to be protected from excessive pressure by means of a pressure-limiting valve.

All components of the lubrication line system such as tubes, hoses, shutoff valves, directional control valves, fittings, etc. must be carefully cleaned before assembly. No seals in the lubrication line system should protrude inwards in a way that disrupts the flow of the lubricant and could allow contaminants to enter the lubrication line system.

Lubrication lines should always be arranged so that air pockets cannot form anywhere. Avoid changes in the cross-section of the lubrication line from small to large cross-sections in the direction of flow of the lubricant. When the cross-section does change,

The flow of lubricant in the lubrication lines should not be hindered by the installation of sharp bends, angle valves, or flap valves. Unavoidable changes in the cross-section in lubrication lines must have smooth transitions. Sudden changes of direction should be avoided if possible.

NOTE

Follow the safety instructions on the lubricant's safety data sheet.

WARNING

Environmental pollution

Lubrication lines must always be free of leaks. Lubricants can contaminate soil and waterways. Lubricants must be properly used and disposed of. Observe the local regulations and laws regarding the disposal of lubricants.

4.6 Note on the rating plate

The rating plate provides important data such as type designation, order number, barcode, and serial number. To avoid loss of this data in case the rating plate becomes illegible, these characteristics should be entered in the following table.

- Enter key data from rating plate in the following table.

Key data from rating plate, Fig. 11

NOTE

During installation and commissioning, check the direction of gerotor pump rotation based on the rotation arrow (see rating plate).

1. Safety instructions

2. Lubricants

1.1 General information

NOTE

The operator of the product described here must ensure that the operating instructions are read and understood by all persons responsible for assembly, operation, maintenance, and repair of the product. In addition to the operating instructions, general statutory regulations and other regulations for accident prevention and environmental protection must be observed and applied.

NOTE

The lubricant notes listed in Chapter 2 "Lubricants" of the assembly instructions also apply without restriction to these operating instructions.

The operator of the product described here must ensure that the operating instructions are read and understood by all persons responsible for assembly, operation, maintenance, and repair of the product. In addition to the operating instructions, general statutory regulations and other regulations for accident prevention and environmental protection must be observed and applied.

3. Delivery, returns, and storage

SKF Lubrication Systems Germany GmbH products are packaged in accordance with standard commercial practice according to the regulations of the recipient's country and DIN ISO 9001. During transport, safe handling must be ensured and the product must be protected from mechanical effects such as impacts. The transport packaging must be marked "Do not drop!"

3.1 Checking the delivery

Immediately after receipt, the delivery must be checked for completeness according to the shipping documents. Any transport damage must be reported to the transport company immediately. The packaging material should be preserved until any discrepancies are resolved.

3.2 Returns

All parts must be cleaned and properly packed before return shipment (i.e., according to the requirements of the recipient country). There are no restrictions for land, air, or sea transport.

The following must be marked on the packaging of return shipments:

	Do not top load / This side up
	Keep dry
	Handle with care. Do not drop

3.3 Lubrication units

- o Ambient conditions: dry and dust-free surroundings, storage in well ventilated dry area
- o Storage time: Max. 24 months
- o Permissible humidity: < 65%
- o Storage temperature: + 10 to +40°C
- o Light: Avoid direct sun or UV exposure and shield nearby sources of heat

3.4 General notes

- o The product(s) can be enveloped in plastic film to provide low-dust storage.
- o Protect against ground moisture by storing on a shelf or wooden pallet.
- o Bright-finished metallic surfaces, especially wearing parts and assembly surfaces, must be protected using long-term anti-corrosive agents before storage.
- o At approx. 6-month intervals:
- o Check for corrosion. If there are signs of corrosion, reapply anti-corrosive agents.
- o Drives must be protected from mechanical damage.

4. Assembly

4. Assembly

4.1 Information on assembly

The assembly procedure for the product is described in detail in the assembly instructions (Chapter 4) associated with these operating instructions.

5. Functional description

5.1 General system description

SKF gerotor pump units of product series 143 are used in circulating-oil and total-loss lubrication systems in a flow rate range of 0.85 to 50 l/min.

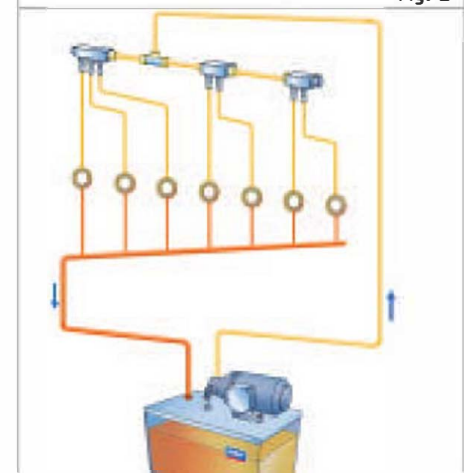

The standard permissible ambient temperature is between 0 and +40°C. Higher ambient temperatures are possible, though they lead to a reduction in motor performance and thus the delivery rate. The permissible temperature of the pumped medium is between 0 to +80°C.

The gerotor pumps are available in NBR and FKM (FPM) designs.

SKF gerotor pump units feed lubricating and hydraulic oils from a reservoir and into the pipe system of a centralized lubrication system. In doing so, they increase the energy of the pumped medium (pressure increase) to overcome flow resistance in the pipelines (pressure loss), the components (filters, valves, distributors) and the bearings and friction points.

centralized lubrication system and the lubricant (see assembly instructions, Chapters 4.3.3 and 4.4.3).

SKF CircOil centralized lubrication system,
Fig. 1

5.2 Gerotor (annular gear) pumps

SKF gerotor pump units of product series 143 have a constant displacement volume and one delivery circuit.

The annular-toothed feeding element, also referred to as the gerotor, is equipped with a cycloid contour, which creates a large tooth meshing length. This yields a low volumetric flow pulsation and thus very smooth running, low noise production, and good suction characteristics.

SKF gerotor pumps consist primarily of pump housing (1), the shaft (2), the displacement elements toothed rotor (3) and annular gear (4), and the lid (5).

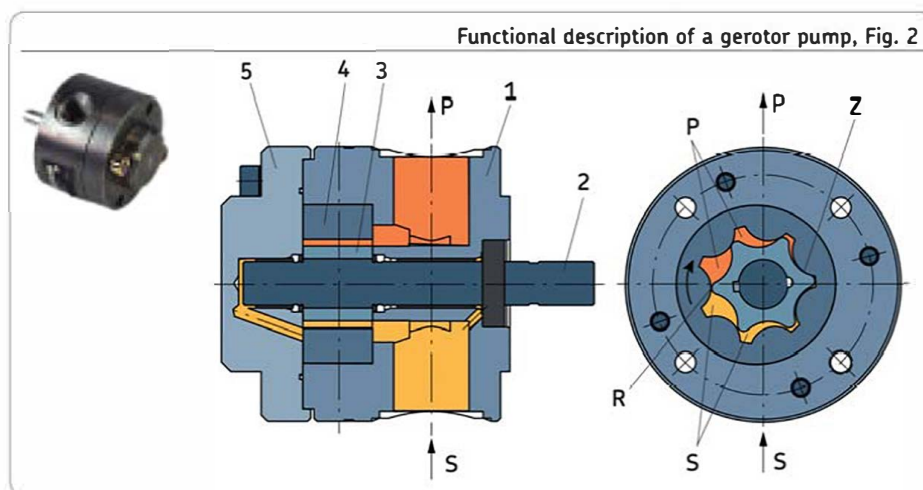

Suction and displacement process

see Figure 2

The shaft drives the centrally mounted toothed rotor in the indicated direction of rotation via a featherkey. The toothed rotor meshes with the outer, eccentrically mounted annular gear and rotates with it.

The openings between teeth arising in the suction area (S) draw the pumped medium in. The suction and pressure area is separated from the tooth meshing area (Z) by a radial gap (R) formed by the tooth profiles of the annular gear and the toothed rotor as

they slide onto one another. In the pressurized area (P), the fluid is fed to the pressure port through increasingly small chambers.

SKF

49

5.3 Gerotor (annular gear) pump units

The gerotor pumps installed in SKF gerotor pump units of series 143 are identical with those described in Chapter 5.2. However, they are driven by an attached IEC squirrel cage motor of frame size 63 to 132.

The motors are designed for a rated motor voltage of 230/400 V or 400/690 V for 50 Hz networks according to DIN IEC 60038. The normal coils used here in motors with performance < 0.75 kW are designed for the wide voltage range. The normal coils in motors with performance ≥ 0.75 kW are tailor-made and meet the IE2 efficiency level according to EU Directive 2009/125/EC. Special voltage versions with special coils for 50 Hz and 60 Hz networks are available for order.

The standard design of the motors comes with a terminal box. Motors with UL/CSA certification are available. Further certifications are available on request.

NOTE

A detailed explanation of the motor rating plates and IEC cage motors is contained in Chapter 11.1 of the enclosed operating instructions.

6. Operation/decommissioning and disposal

6.1 Operation

NOTE

The gerotor pump may only be commissioned and operated with an oil supply; the gerotor pump must not run dry.

An excessively low lubricant fill level can lead to a low delivery rate and possible destruction of the pump. Therefore, do not let the lubricant fall below the minimum fill level.

6.2 Commissioning

NOTE

Only fill using clean lubricant and an appropriate device. Contaminated lubricants lead to system malfunctions. The customer's lubricant reservoir must be filled without introducing bubbles.

	<div style="background-color: #FFD700; padding: 5px; text-align: center;">WARNING</div> <p>Hazard due to excessively low or no lubricant</p> <p>The lubricant fill level in the lubricant reservoir should be subjected to visual inspection on a regular basis. SKF recommends the attachment of a fill level switch to the customer's system.</p>
---	---

Inspect all electrical and hydraulic connections before commissioning the gerotor pump or gerotor pump unit.

The intake and return lines in the lubricant reservoir must be below the minimum lubricant level in all operating states.

- Check the direction of pump rotation based on the rotation arrow.
 - Place an oil tray under the gerotor pump unit.
 - See the operating instructions from the system manufacturer.
 - Prefill the pump with filtered lubricant via the suction or pressure port.
 - Vent the pump according to the operating instructions from the system manufacturer.
- If switchable or automatic venting is not available, the gerotor pump unit must be manually vented as described below.
- Switch the centralized lubrication system to pressureless circulation mode according to the operating instructions from the system manufacturer.

6.1.1 General

The described product functions automatically. The lubricant transport in the lubrication lines should, however, be subjected to regular visual inspection.

The lubricant fill level in the lubricant reservoir should be subjected to visual inspection on a regular basis.

SKF

51

6.3 Recommissioning after downtime

- Prefill the gerotor pump unit with oil and briefly switch the unit on and off (jogging).
- Repeat the procedure until bubble-free lubricant discharges.
- Firmly reattach the suction or pressure port.

The process of venting the centralized lubrication system can be facilitated by:

- Filling long pipe sections before connecting to the lubrication points.
- Filling the lubricant lines
- Allowing the gerotor pump unit to run until bubble-free and foam-free lubricant discharges at the end of the lubricant lines
- Switching off the gerotor pump unit, if necessary

- Disconnect the delivery line (provided by customer) and prefill the gerotor pump unit.
- Establish the electrical motor connection as described in Chapter 4.4.6 of the assembly instructions.
- Check the direction of motor rotation based on the rotation arrow.
- Check the fill level of the lubricant.
- Switch on the gerotor pump unit and recheck the lubricant fill level.
- A low fill level (=leakage) indicates that there is leakage below the lubricant fill level, while an elevated fill level indicates leakage above the fill level.
- If the pump/lubrication system are intact => system approval.

6.4 Temporary shutdown

The product described here can be shut down temporarily by relieving pressure in the system/the gerotor pump and disconnecting the electrical supply connection and/or the mechanical drive.

The instructions in Chapter 4 of the assembly instructions must be observed when doing so.

If the product is to be shut down for an extended period of time, follow the instructions in chapter "Transport, delivery, and storage" of these operating instructions.

Corrosion protection must be applied to the gerotor pump if it is to be removed and stored.

SKF recommends the following procedure:

- Empty and clean the gerotor pump.
- Seal the pressure bore air-tight using plugs.
- Fill the gerotor pump with new lubricant

6.5 Decommissioning and disposal

- Clean the exterior of the gerotor pump and spray it with a suitable anti-corrosive agent.
- Package the gerotor pump together with suitable desiccant air-tight in an anti-corrosive film.

To recommission the product, follow the instructions in Chapter 4 "Assembly" of the assembly instructions.

		WARNING
	System pressure Hydraulic pressure Lubrication systems are pressurized during operation. Centralized lubrication systems must therefore be depressurized before starting assembly, maintenance, or repair work, or any system modifications or system repairs.	

- Place an oil tray under the gerotor pump/unit.
- Depressurize the centralized lubrication system as described in the system's operating instructions.
- Loosen and remove the intake and delivery tubing.
- Loosen and remove the fastening screws on the gerotor pump/unit.
- Remove the gerotor pump/unit.

If the product will be permanently shut down, the local regulations and laws regarding the disposal of contaminated equipment must be observed.

		WARNING
	Environmental pollution Lubricants can contaminate soil and waterways. Lubricants must be properly used and disposed of. Observe the local regulations and laws regarding the disposal of lubricants.	

The product can also be returned to SKF Lubrication Systems Germany GmbH for disposal, in which case the customer is responsible for reimbursing the costs incurred. The parts are recyclable.

SKF

EN

7. Maintenance

7. Maintenance

7.1 General information

		WARNING
	Electric shock Assembly, maintenance and repair work may only be performed on products that have been de-energized by qualified technical personnel. The supply voltage must be switched off before opening any of the product's components.	

For safety reasons, the product must be disconnected from the power supply. Do not allow any cleaning agent to enter the interior of the product during cleaning. The interior of the product does not need to be cleaned. The interior of the product must be cleaned if incorrect or contaminated lubricant is accidentally filled into the product. Contact the SKF Service department if this occurs.

NOTE

Only original SKF spare parts may be used. Unauthorized alterations to products and the use of non-original spare parts and accessories are prohibited and nullify the statutory warranty.

SKF shall not be held liable for damages resulting from improperly performed assembly, maintenance, or repair work on the product.

SKF products are low-maintenance. All connections and fittings must be regularly inspected for proper seating to ensure proper function. If necessary, the product can be cleaned using mild cleaning agents that are compatible with the product's materials (non-alkaline, non-soap).

NOTE

Dismantling of the product or individual parts thereof within the statutory warranty period is prohibited and voids any claims.

NOTE

Only fill using clean lubricant. The purity of the lubricants used is the decisive factor in the service life of the pump and the lubricated machinery elements.

7.2 Maintenance schedule

The maintenance intervals are system-specific and affected by environmental influences such as dust and heat, among other factors.

The maintenance intervals are therefore defined by the system manufacturer.

A maintenance schedule must be drawn up for the safe operation and long service life of gerotor pumps/units. This schedule must ensure that the intended or permissible operating conditions and parameters of the gerotor pump are observed during its service life.

Changes in these parameters indicate wear, for example to the electric motor, the coupling, or the pump.

The cause must be immediately determined and remedied.

SKF recommends continuous monitoring of the parameters listed in Table 1 to provide high dependability of the gerotor pump/unit.

The system/gerotor pump must be switched off in case of changes beyond normal fluctuations in the intended operating range.

Plastic components of the drive couplings must be checked according to manufacturer specifications (see the manufacturer's operating and assembly instructions) on a regular basis. Coupling parts should be replaced at least every 5 years.

The manufacturer's specifications should be given priority.

- o Plastic housing drive couplings

SKF

55

EN

8. Malfunctions, causes, and remedies

The following tables provide an overview of possible malfunctions and their causes. Contact the SKF Service department if you cannot remedy the malfunction.

NOTE

Dismantling of the product or individual parts thereof within the statutory warranty period is prohibited and voids any claims.

NOTE

Only original SKF spare parts may be used. Unauthorized alterations to products and the use of non-original spare parts and accessories are prohibited.

WARNING

System pressure
Lubrication systems are pressurized during operation. Lubrication systems must therefore be depressurized before starting assembly, maintenance or repair work, or any system modifications or system repairs.

WARNING

Hot surface
The hot surface of the pump or motor may cause burns. Motor and pump surfaces may only be touched with appropriate gloves or after the motor has been shut off for an extended time.

WARNING

Electric shock
Performing work on products that have not been de-energized may result in serious injury or death. Assembly, maintenance, and repair work may only be performed on products that have been de-energized by qualified technical personnel. The supply voltage must be switched off before opening any of the product's components.

9. Technical data

9.1 Technical data

The technical data for the gerotor pumps/units can be found in the assembly instructions, Chapter 4.3.3, pages 30/31.

The technical data for the gerotor pump units can be found in the assembly instructions, Chapter 4.4.3, pages 36/37.

For connection with a frequency of 60 Hz, the speed and the volumetric flow are increased by 20% (compared to the table specifications, basis 50 Hz).

Delivery rates and characteristic curves

The indicated nominal delivery rates refer to the nominal output multiplied by the speed 1400 or 2800 rpm. The actual delivery rate changes with operating viscosity and back pressure and can be found in the following characteristic curve diagrams. These diagrams are based on viscosity data in the range between 20 and 1000 mm²/s in increments of 20, 140, 750, and 1000 mm²/s. Each gerotor pump has a characteristic curve represented as a function of the delivery rate above the delivery pressure (back pressure).

It is important to note that temperature influences can render lubricating and hydraulic oils extremely thin or viscous. Please consult with SKF in advance if you will use lubricating and hydraulic oils with an operating viscosity outside the specified range.

10	50.00

1) Tolerances: VDMA 24284-II

see Chapters 9.6.1 and 9.6.2

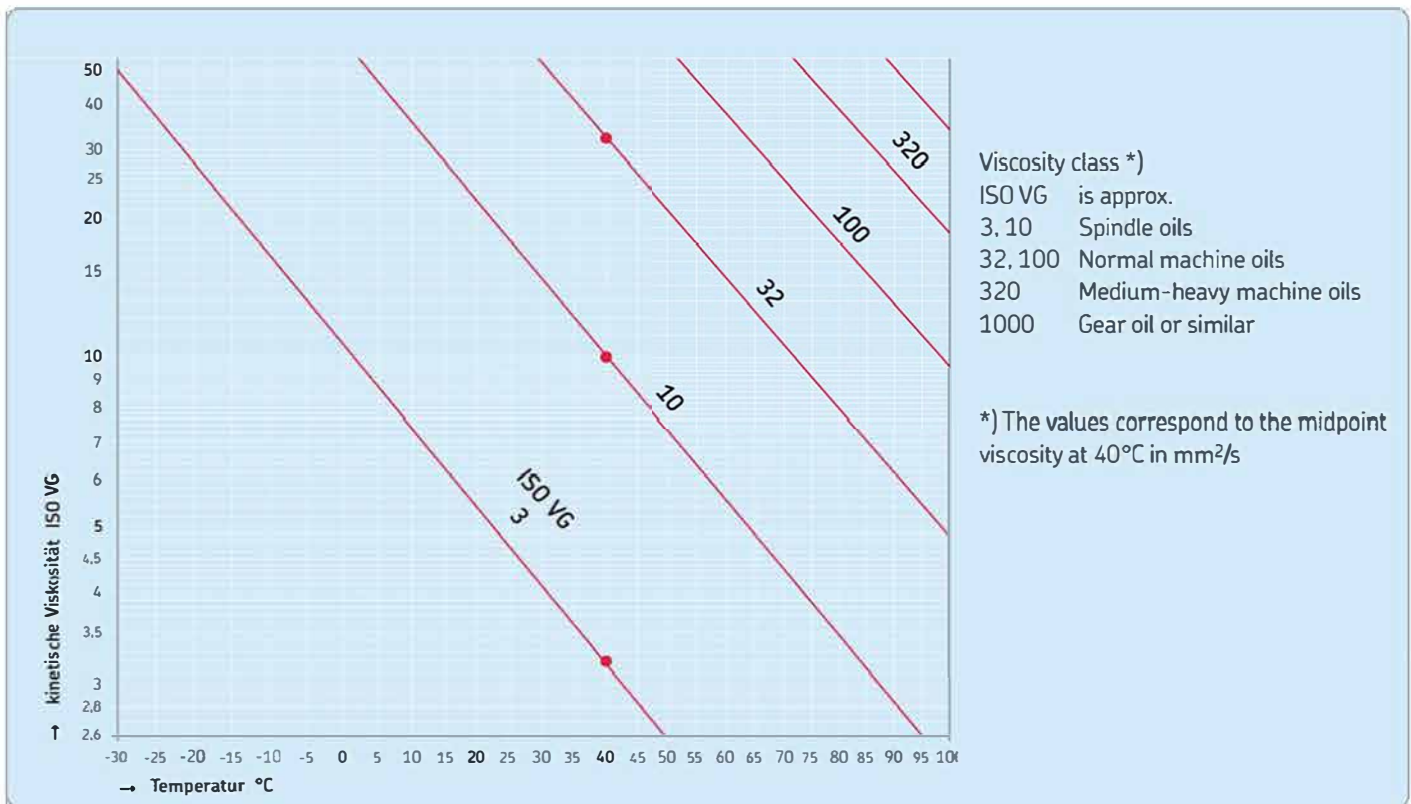

The curves shown in both figures are based on a viscosity index (VI) of VI ~ 95, approximately corresponding to standard mineral oil.

The viscosity index describes the slope of the curve and thus the viscosity-temperature relationship at temperatures other than +40°C.

The lines appear straight because a logarithmic scale was selected for the ordinate so that the slope of the curves can be determined easily based on 2 measuring points.

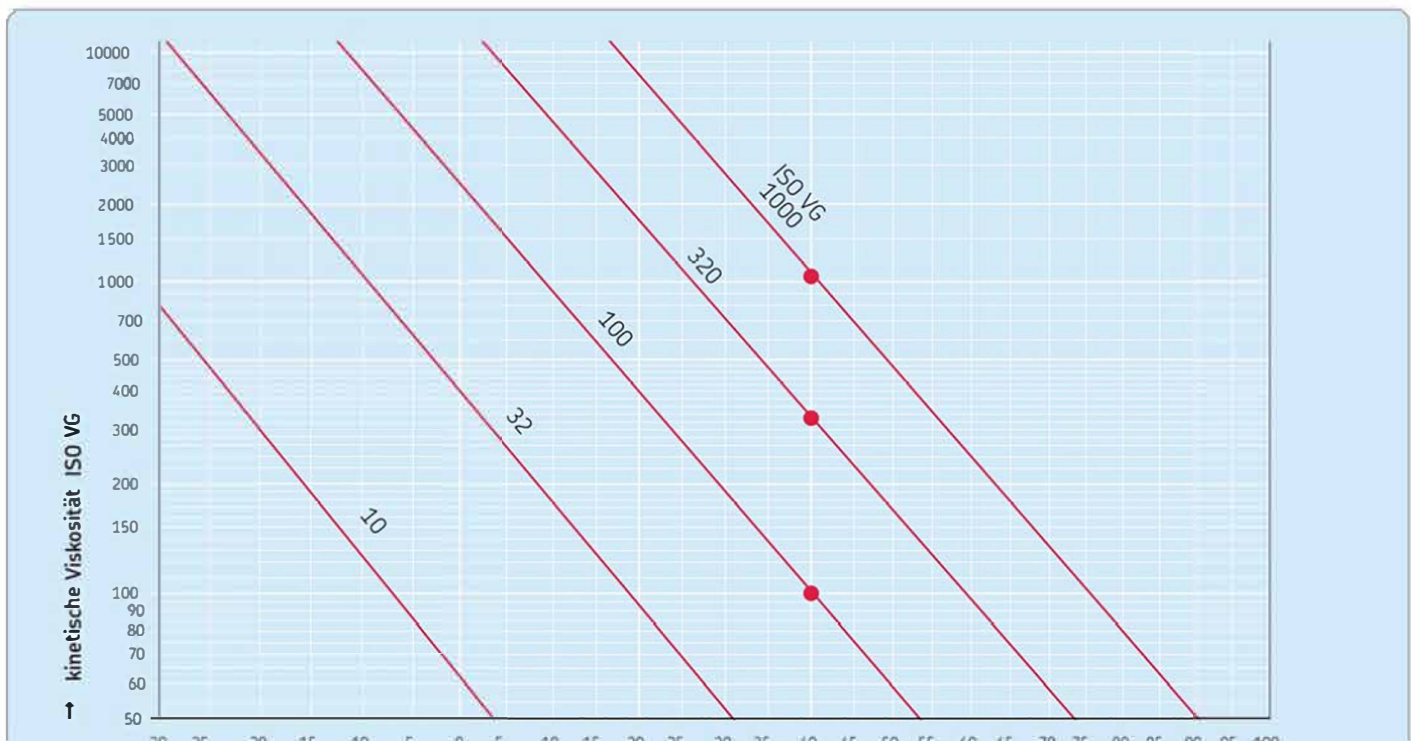

Important note: The change in the viscosity of oils is disproportionately greater in lower temperature ranges than in higher temperature ranges. For example, an oil with a rated viscosity of 100 undergoes the following viscosity change in different temperature

at +80°C = 18 mm²/s
at +10°C = 875 mm²/s
versus:
at +75°C = 21 mm²/s
change of 3 mm²/s
at + 5°C = 1450 mm²/s
change of 575 mm²/s

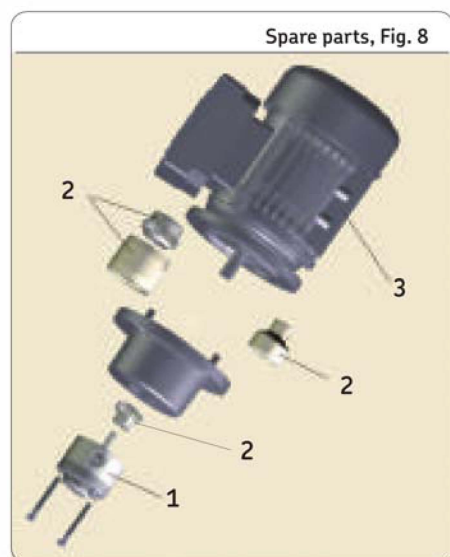

9.6.1 Viscosity range from 2.6 to 50 mm²/s

SKF

63

9.6.2 Viscosity range from 50 to 2000 mm²/s

11. Appendix

11.1 IEC squirrel cage motors

11.1.1 Principles

General information

The standard design of SKF gerotor pump units of product series 143 is driven by IEC squirrel cage motors. The motors are used in frame sizes 63 to 132, in 2-pole and 4-pole designs.

They meet the relevant IEC/EN standards both mechanically and electrically.

The standard design of the motors comes with a terminal box. The motors bear a CE marking in accordance with Low Voltage Directive 2006/95/EC.

There is no CE marking with respect to Machinery Directive 2006/42/EC and EMC Directive 2004/108/EC because three-phase motors do not fall under the scope of these Directives.

Special provisions

The motors can be ordered in a UL- and CSA-compliant design and are approved as a "recognized component" by UL (Underwriter Laboratories).

These motors have an electrical design according to NEMA MG1-12.

CSA BG56-80 File No.: LR 88093
(listed under Master Contract No. 150227)

CSA BG90-132 File No.: LR 12638
(listed under Master Contract No. 150227)

UL BG56-80 File No.: E123665
(combined acceptance per UL 1004 and CSA 22.2.100)

UL BG90-132 File No.: E125750
(combined acceptance per UL 1004 and CSA 22.2.100)

Further certifications are available on request.

Types

The motors are used exclusively in the types IM B34 and IM B14. The type is indicated according to Code I, DIN EN 60034-7 on the rating plate.

IM B34: Shaft horizontal, feet on floor

IM B14: Shaft horizontal, no feet

Rated voltage, frequency, and power

The motors are designed standard for a rated motor voltage of 230 V, 400 V, or 690 V for 50 Hz networks (normal coils) according to DIN IEC 60038. Motors for other voltages and frequencies (special coils) are available on request.

The permissible operating voltage deviation in the specified rated motor voltages and special voltages per DIN EN 60034-1 is $\pm 10\%$ and the permissible frequency deviation is $-5/+3\%$.

The tolerances according to DIN EN 60034-1 are maintained at supply voltages on the order of 95% or 105% of the rated motor voltage.

Further, motor heating may exceed the permissible temperature limit by 10 K. Higher heating is permissible, though continuous operation (duty) of the motors at higher temperatures is not recommended.

Motors for a rated motor voltage of 230 V or 400 V for 50 Hz networks (normal coil) and

SKF

67

with performance < 0.75 kW are designed for the wide voltage range for 50 and 60 Hz networks. The motors can be used in continuous duty (S1) within this wide voltage range. The wide voltage range is indicated on the motor's rating plate.

Wide voltage range:

50 Hz: 220–240 V / 380–420 V,
voltage tolerance $\pm 5\%$

60 Hz: 254–280 V / 440–480 V,
voltage tolerance $\pm 5\%$

The use of the wide voltage range is permitted because these motors are not subject to EU Directive 2005/32/EC (Energy Using Products) and therefore do not need to comply with EU Regulation No. 640/2009 with regard to adherence to efficiency classes.

These motors do not bear an IE2 marking on the rating plate.

Motors for special voltages with performance < 0.75 kW contain special coils that

Special voltage designs for 50 Hz and 60 Hz networks are available and must be indicated when ordering.

Motors with performance ≥ 0.75 kW are optimized for one voltage/frequency point and are designed solely on a tailor-made basis. They are designed standard for a rated motor voltage of 230 V, 400 V, or 690 V for 50 Hz networks (normal coils) according to DIN IEC 60038. They meet efficiency class IE2 according to EU Directive 2005/32/EC (Energy Using Products). These motors bear an IE2 marking on the rating plate. Motors for special voltages with performance ≥ 0.75 kW contain special coils that are optimized for one voltage/frequency point.

Special voltage designs for 50 and 60 Hz networks are available for all rated motor voltages commonly used worldwide and must be indicated when ordering.

The stated performance ratings and operating values are valid for duty type S1 ac-

temperature of max. 40 °C, and a site altitude of up to 1000 m above sea level.

Motors for operating conditions other than those indicated are available on request.

Circuit

The phase belts of the motor that are laid on the terminal board can be interconnected in two different connection systems.

Star connection

In the star connection, the coil ends U2, V2, and W2 are interconnected on the terminal board, creating the neutral point. Mains power is connected on the free connection ports of the coil ends U1, V1, and W1 on the terminal board.

Delta connection

In the delta connection, the end of the phase belt is interconnected with the beginning of the next phase belt.

(U2 to V1, V2 to W1, W2 to U1).

Mains power is connected at the connection

Cooling method

The motors are designed for cooling method IC 411 (surface cooling).

Temperature class

The insulation on the motor coils is designed for temperature class 155 (F). When utilized at their performance rating, the motors meet temperature class 130 (B). Given a coolant temperature of 40°C, the power reserve is thus approx. +10%; when operated at their performance rating, the temperature reserve is approx. +20 K.

Terminal box

The terminal boxes have a protection class of IP55. The terminal box is positioned on the right when viewed from the drive side. An exception are 4-pole motors of frame size 90 (1.1 and 1.5 kW), in which the terminal box is installed on the top for design reasons. Special motors with the terminal box positioned on the left as viewed from the drive side are available on request. The position of the openings for cable entry can be adjusted to the available connections by turning the terminal box by 90° each

time (terminal box design 95×95 mm). Terminal boxes with dimensions 120×115 mm can only be turned by 180°. The threads on the cable inlets have a metric thread of M20×1.5. The terminal board has a 6-pole design.

Protection class

The motors are designed for protection class IP55 according to DIN EN 60034-5.

Touch and foreign object protection: Complete protection against contacting live components and against approaching such parts, as well as against touching moving parts within the housing. Protection against the ingress of damaging amounts of dust deposits.

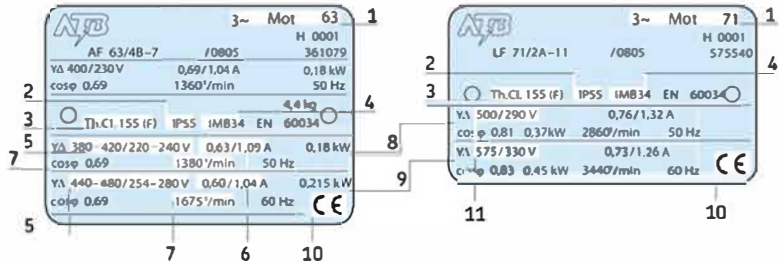

Water protection: A jet of water that is emanating from a nozzle and aimed at the motor from all directions has no adverse effect.

The Power of Knowledge Engineering

Over the course of more than a century, SKF has specialized in five fields of competence and acquired a wide range of application expertise. We utilize this experience to provide innovative solutions to OEMs and other manufacturers in practically all industrial sectors worldwide. Our five fields of competence are: bearings and bearing units, seals, mechatronics (combining mechanical and electronic components to improve the performance of classic systems), and extensive services from 3-D computer simulations and modern condition monitoring systems for high reliability to system management. SKF is a leading global company and guarantees its customers uniform quality standards and global product availability.

Important information on product usage

All products from SKF may be used only for their intended purpose as described in this brochure and the operating instructions. Should operating instructions be supplied together with the products, they must be read and followed.

Not all lubricants can be fed using centralized lubrication systems. SKF can, on request, inspect the suitability of the lubricant selected by the user for pumping in centralized lubrication systems. Lubrication systems and their components manufactured by SKF are not approved for use in conjunction with gases, liquefied gases, pressurized gases in solution, vapors, or such fluids whose vapor pressure exceeds normal atmospheric pressure (1013 mbar) by more than 0.5 bar at their maximum permissible temperature.

Particular attention is called to the fact that hazardous materials of any kind, especially the materials classified as hazardous by EC Directive 67/548/EEC, Article 2, Para. 2, may only be filled into SKF centralized lubrication systems and components and delivered and/or distributed with such systems and components after consulting with and obtaining written approval from SKF.
